

ABSTRACT

A livestock loading chute is suitable for attachment to the rear frame of any dock loading livestock trailer to permit either dock loading or ground loading of livestock. The livestock loading chute includes an upper chute section, attached to the rear frame of the trailer, and a lower chute section, which is supported by the upper chute section. The upper chute section, which is aligned with the trailer's roll-up door, contains an upper chute section ramp adjustable between a horizontal position for dock loading and an inclined position for use in conjunction with the lower chute section for ground loading.
